<p>STATUS: The Dugger Electric Company began business in 1920. The company repaired electric equipment including transformers. Some of the cooling oil in the transformers contained PCBs. PCBs have been found in the soils in the transformer storage area, in the sediments in a ditch that drains the storage area, and in the extensive old underground mining works underlying the Town of Dugger. IDEM has sampled many of the dumping holes that extend into the old works. Groundwater monitoring wells have also been drilled. At this time, IDEM does not believe that the full extent of the PCB contamination is known. Plans are being developed to more accurately determine the extent and amount of PCBs that are present beneath Dugger.</p>
